L'objectif est de développer un système de mesure et de transmission intégré dans les joints HUTCHINSON permettant de détecter l'état d'un ouvrant de type battant ou coulissant

- Détection intégrée directement aux joints
- Communication des informations via une liaison sans fil
- Intégration discrète et esthétique
- Temps de réaction @ ≈ seconde
- Autonomie @ ≈ 5 ans

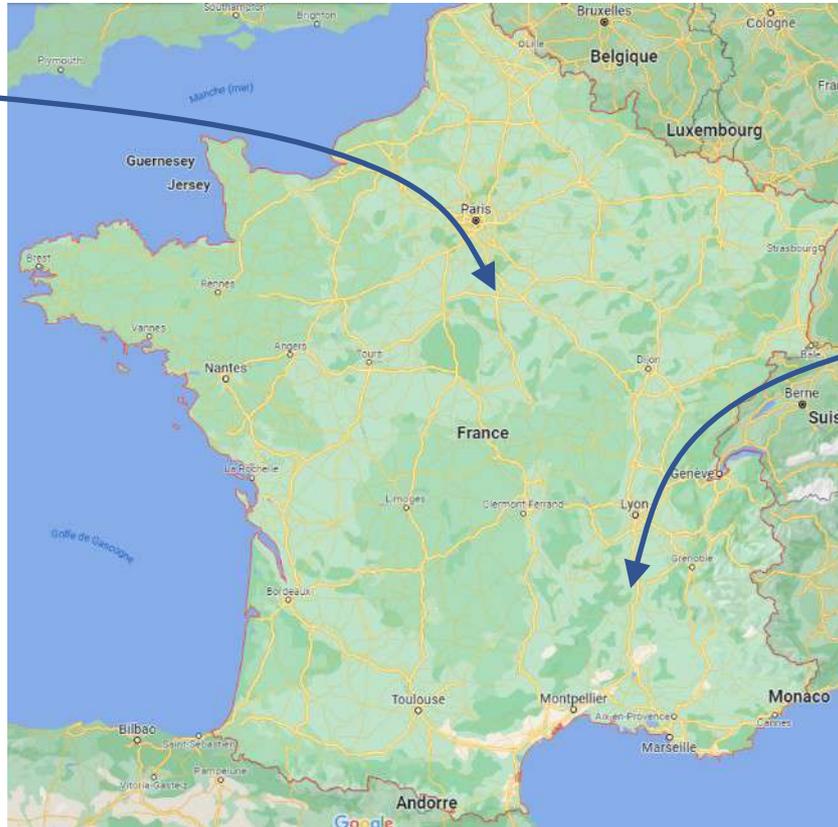

Détecteur magnétique

45120 CHALETTE S/ LOING

Centre de Recherche et d'Innovation

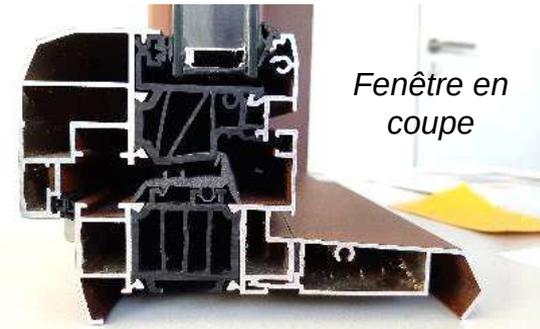

Partenaires : @todo

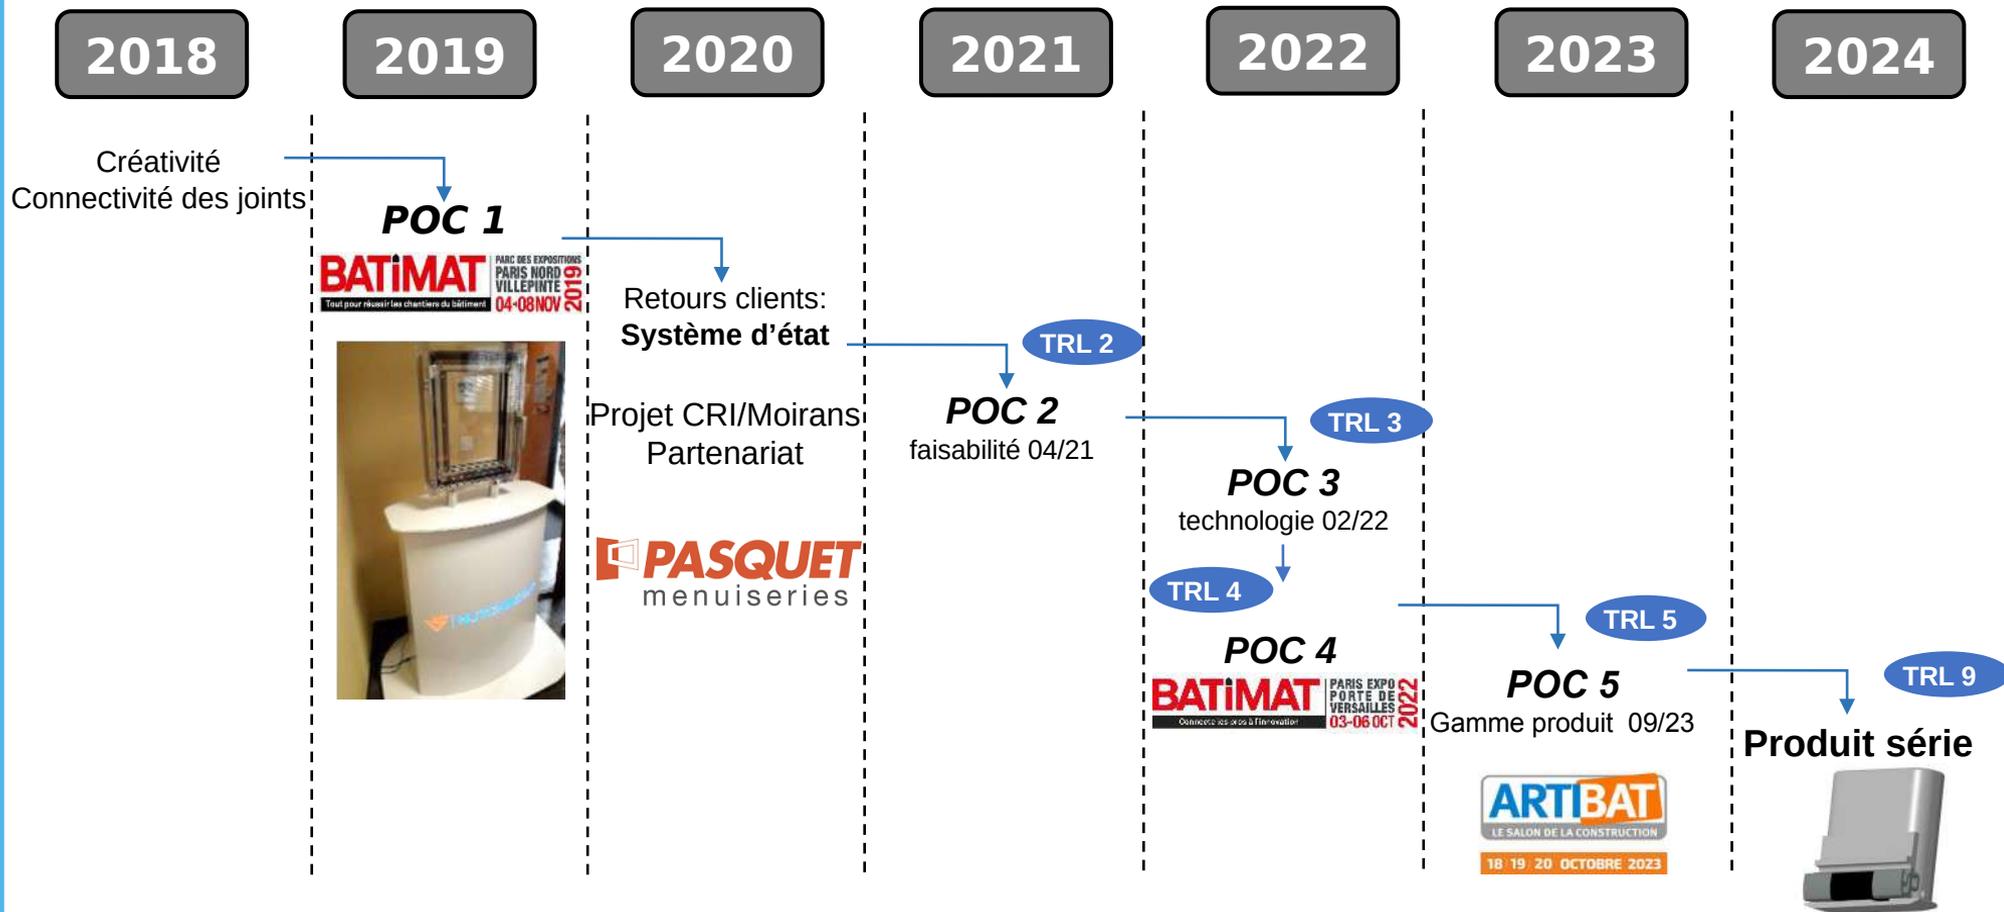

38 430 MOIRANS

Étanchéité bâtiment

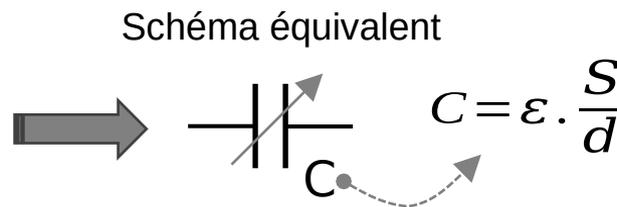

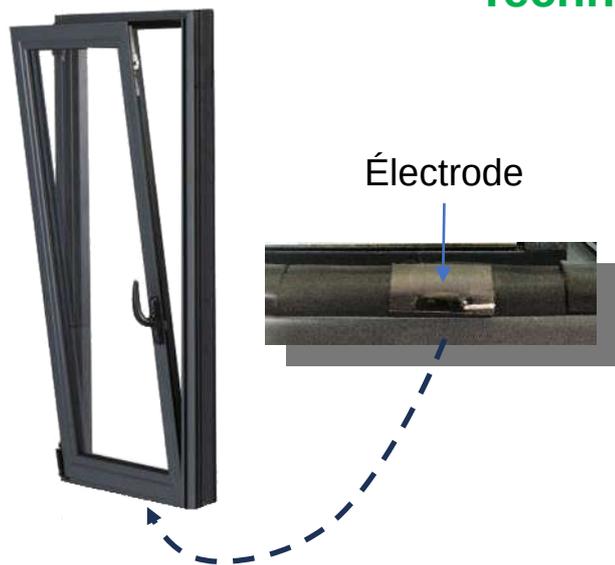

Fenêtre en coupe

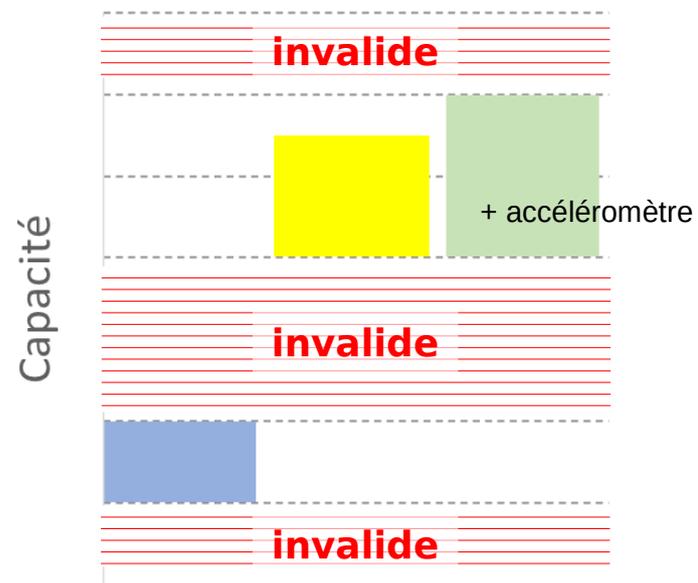

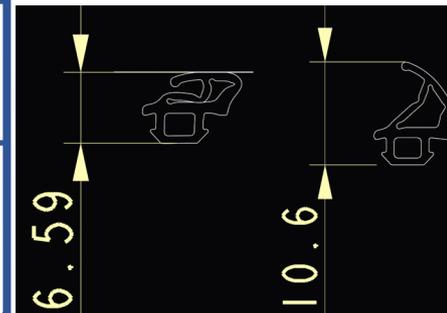

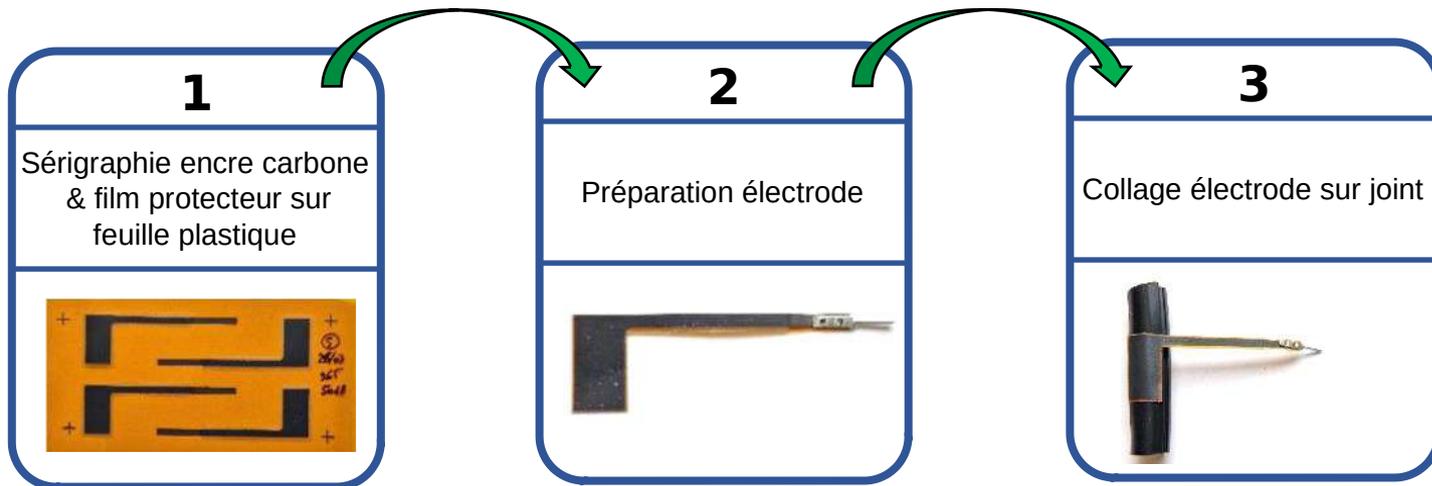

La détection est basée sur les variations d'une capacité électrique. Le condensateur est constitué d'une simple électrode conductrice ajoutée au joint et variant suivant la permittivité du milieu environnant.

Technologie et utilisation brevetée

- ouvert
- verrouillé
- oscillo battant

- La société OTODO a été créée en 2016
- OTODO commercialise en marque blanche une plateforme d'interopérabilité dédiée à la maison connectée, notamment destinée aux opérateurs de services et/ou télécoms.
- Située à Tours et Paris

Matter c'est :

- Un standard de connectivité pour la domotique, dérivé du protocole Zigbee. Il a été conçu pour améliorer la communication entre les appareils domotiques, quel que soit leur vendeur/fabricant, et pour assurer leur interopérabilité.
- Il définit les couches OSI au-dessus de IPV6
- S'appuie sur des standards existants (protocoles sur IP (LAN), Thread, BLE, Zigbee...)
- Est géré par le consortium CSA (Connectivity Standards Alliance) ex Zigbee

Termes à retenir :

MATTER :

- Fabric
- Commissioner : Node ayant la capacité de commissioner un autre Node.
- Administrator (Node ayant tous les droits d'accès).
- Node (~device) = Entité adressable (Attention il va falloir jongler entre ces deux termes !)

Wi-Fi

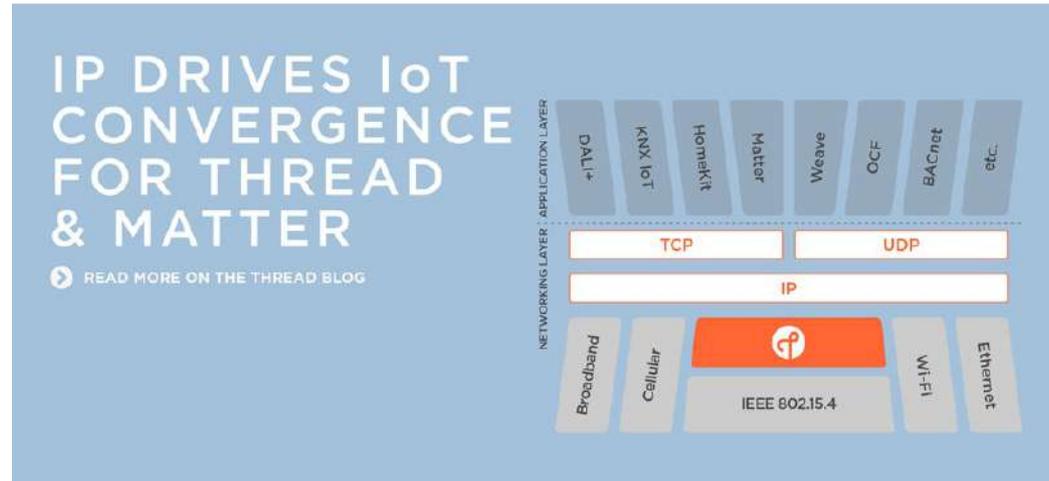

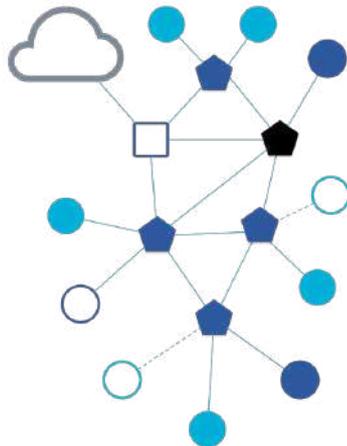

- AP (Access Point)
- SSID (Identifiant du réseau)
- Password (mot de passe du réseau)

Thread

- Border Router ou OT-BR (Open Thread Border Router)
- Router (équipement alimenté en permanence (prise, lampe) permettant d'étendre le réseau Thread)
- DATASET (~ SSID/PWD Wi-Fi + numéro de canal +...)

Thread est :

- un protocole radio (basé sur le 802.15.4 en 2.4GHz, comme pour zigbee)
- un protocole bas débit
- plutôt destiné aux objets basse consommation
- supporte le maillage
- IPV6 (avec quelques limitations) - facilite le développement de passerelles LAN-Thread

Les étapes du Commissioning

1. Découverte de l'objet (BLE, On-Network)
2. Obtention des infos permettant d'identifier l'objet
3. Recherche de l'objet dans l'environnement proche
4. Établissement d'une première connexion sécurisée
5. Vérification de son authenticité et sa certification
6. Configuration pour l'intégration dans le réseau local
7. Détection de l'objet sur le réseau local
8. Établissement d'une session sécurisée pour la communication "matter"

Comment identifier l'objet?

Les informations disponibles sur l'objet sont :

- **Vendor ID** : Permet d'identifier le fabricant (la marque) (optionnel sur le manual pairing code)
- **Product ID** : Permet d'identifier le produit (associé à la marque) (optionnel sur le manual pairing code)
- **Discovery Capabilities** (BLE, on network). Dans tous les cas le commissioner fera aussi une découverte à l'aide de DNS-SD
- **Discriminator** : entier sur 12 bits permettant de différencier plusieurs objets identiques (4 bits sur le manual pairing code)
- **Passcode** : Entier 27 bits utilisé en tant que preuve de possession. Évite que le voisin ou une personne mal intentionnée commisionne l'objet à notre place.

- **Manual pairing code**

Short : 34970112332

Long : 749701123309050652796

- **QR Code**

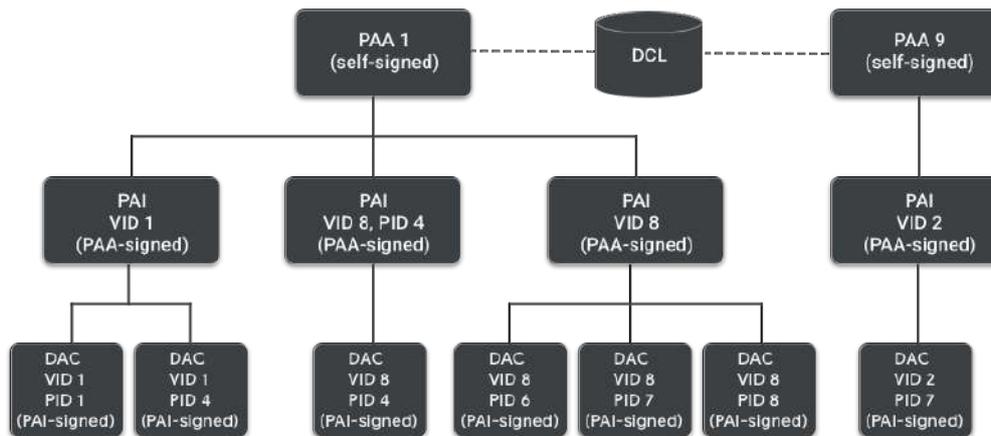

MT:C8XA0-1K010O0648G00

VID	0x235A (9050)
PID	0x4541 (17729)
Discriminator	0x0F01 (3841)
Setup Pin Code (Password)	20202022
Pairing	BLE

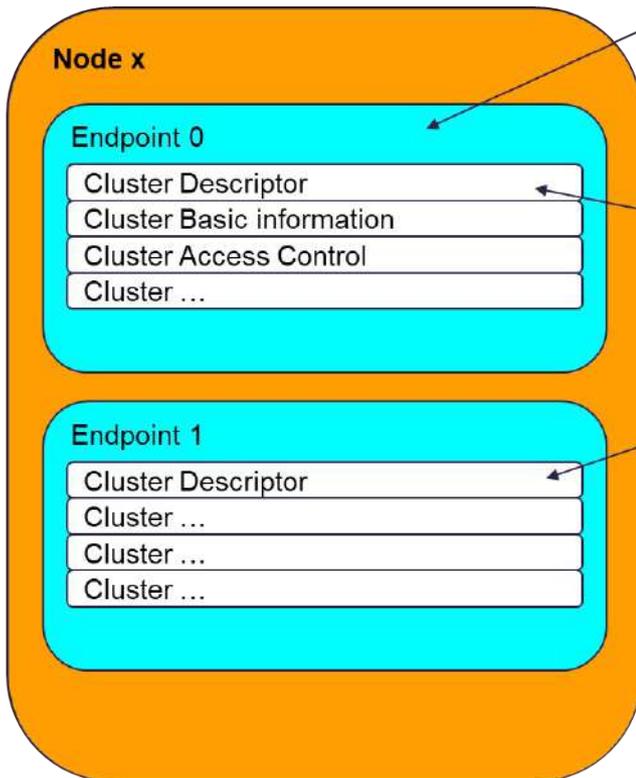

Vérification de l'authenticité et du statut de la certification de l'objet?

- repose sur une infrastructure à clés publiques (PKI)
- Les PAI et DAC sont sauvegardés dans chaque objet.
- Les PAA sont stockés sur le serveur DCL (qu'il faudra donc interroger périodiquement).

PAA : Product Attestation Authority, **PAI** : Product Attestation Intermediate, **DAC** : Device Attestation Certificate

Le modèle :

Le Endpoint 0 est obligatoire pour chaque Node.
C'est le point d'entrée de la découverte de l'objet.
Il doit implémenter le device type "Root Node"

Chaque Endpoint a un cluster "Descriptor"

Il indique le(s) type(s) de device implémenté(s)
par le endpoint

Les device Type sont figés pour une version de
spec. Ils sont décrits dans le document "Matter
Device Library"

Un device type précise quels cluster doivent
êtres implémentés.

Pourquoi certifier ?

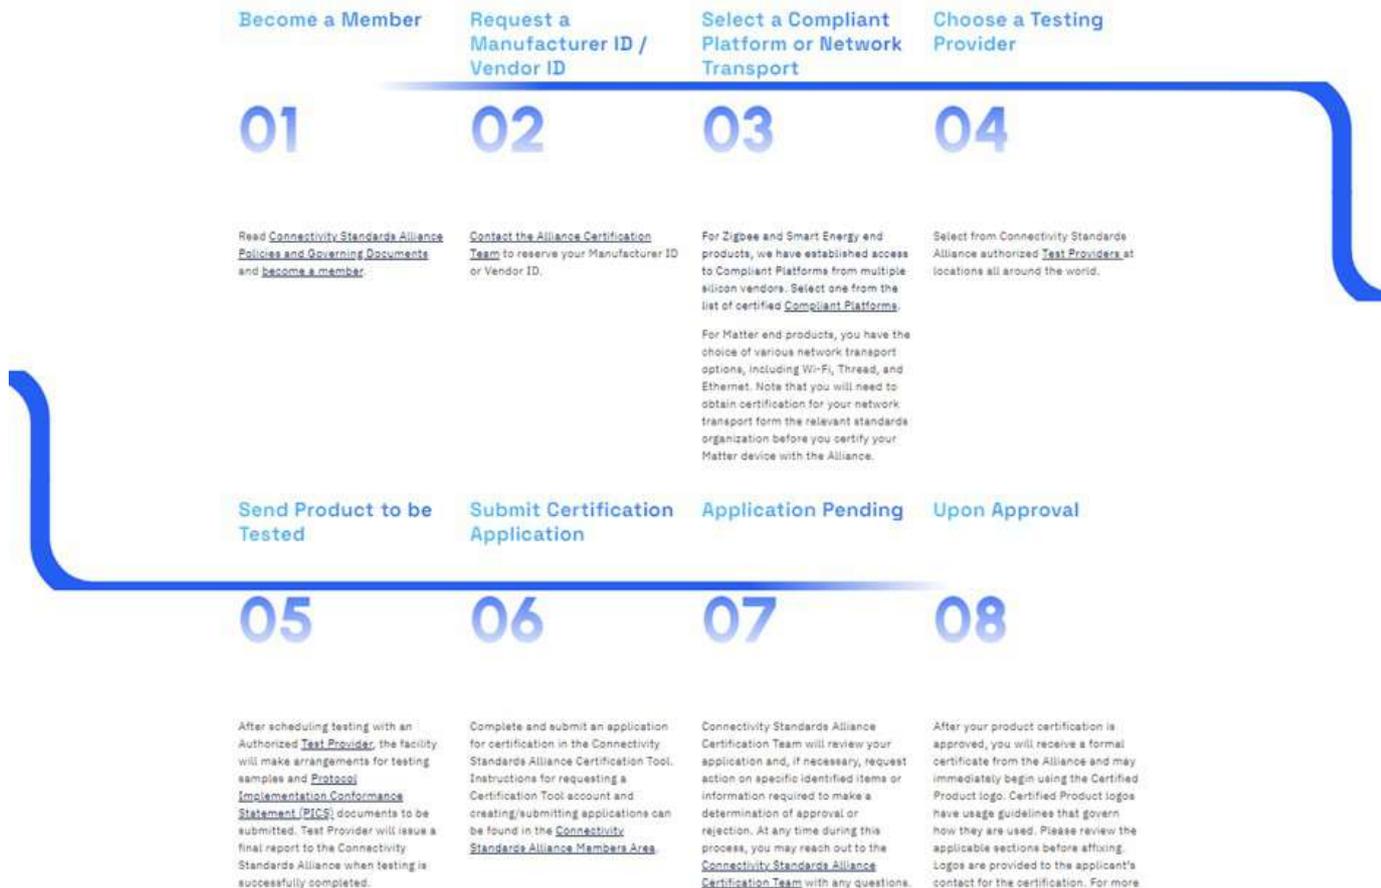

En plus de la reconnaissance de la conformité à une spécification du CSA, la certification permet l'utilisation de logos de produits certifiés et la liste du produit sur le site Web de l'Alliance à des fins de vérification. La certification indique la conformité à une spécification et montre l'interopérabilité dans le programme respectif.

Avantages de la certification des produits :

Indique clairement et indépendamment l'interopérabilité avec les produits des plus grandes marques mondiales

Réduit les barrières à l'entrée sur le marché grâce à l'accès à un vaste écosystème technologique

Permet d'utiliser des logos de produits certifiés exclusifs Connectivity Standards Alliance et une liste de produits sur le site Web de Connectivity Standards Alliance.

Otodo a certifié le firmware de son Hub-MZ

- Longue autonomie
- Faible encombrement
- Supporte Matter

Début de solution

- Technologie radio : Thread

Device types

OpenThread distinguishes between different device types depending on what roles a device can take in the Thread network.

Full Thread Device (FTD)

An FTD can be both a router and an end device. Its radio is always on.

Minimal Thread Device (MTD)

An MTD is always an end device. It forwards all messages to its parent.

There are two important subtypes:

Minimal End Device (MED)

An MED keeps its transceiver always on.

Sleepy End Device (SED) and Synchronized Sleepy End Device (SSED)

An SED is usually off and wakes occasionally to receive messages from its parent.

An SSED is an enhanced SED. It transmits less data than an SED and relies on receiving messages from its parent only in specified time intervals.

For more information, see the [Thread device types](#) page.

Device types

OpenThread distinguishes between different device types depending on what roles a device can take in the Thread network.

Full Thread Device (FTD)

An FTD can be both a router and an end device. Its radio is always on.

Minimal Thread Device (MTD)

An MTD is always an end device. It forwards all messages to its parent.

There are two important subtypes:

Minimal End Device (MED)

An MED keeps its transceiver always on.

Sleepy End Device (SED) and Synchronized Sleepy End Device (SSED)

An SED is usually off and wakes occasionally to receive messages from its parent.

An SSED is an enhanced SED. It transmits less data than an SED and relies on receiving messages from its parent only in specified time intervals.

For more information, see the [Thread device types](#) page.

Minimal Thread Devices

Minimal Thread Devices (MTDs) are devices that do not maintain a routing table and are typically low-power devices that are not always on. They can only be End Devices, and they always need a parent to function. They forward all their messages to their parent.

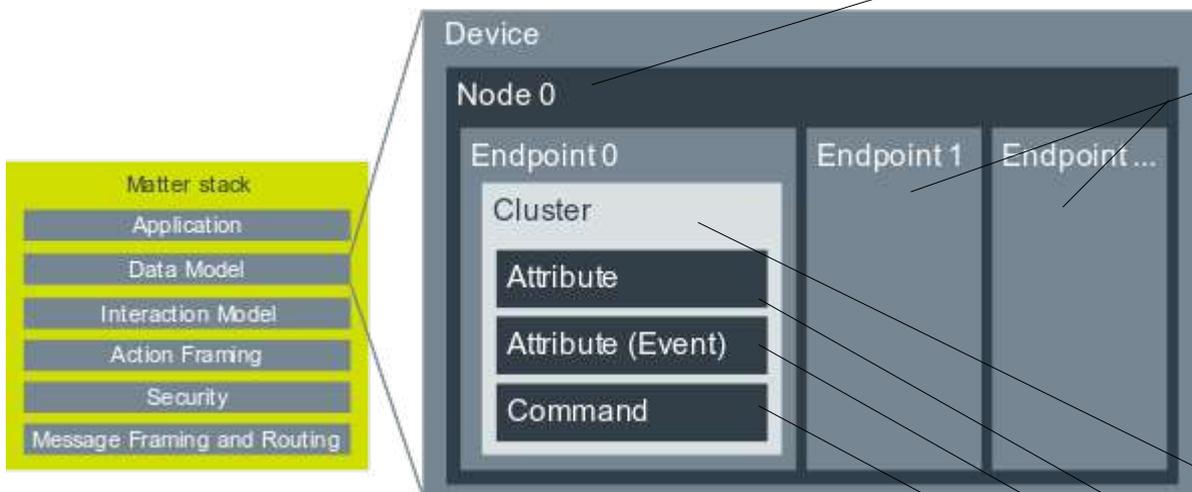

Minimal Thread Devices can be further divided into three categories:

- Minimal End Device (MED)
- Sleepy End Device (SED)
- Synchronized Sleepy End Device (SSED)

	Minimal End Device	Sleepy End Device	Synchronized Sleepy End Device
Maintains a routing table	No	No	No
Radio	Always enabled	Periodically enabled	Periodically enabled
New messages	Parent immediately forwards the messages	The SED polls for new messages when it wakes up	Parent forwards the messages during designated transmission window or when SSED explicitly polls data
No new messages	No data transmission	Parent indicates no pending messages	No data transmission*

Minimal Thread Device categories

• Meta-Model | data model

Ressource unique identifiable et adressable dans le réseau composée d'un ensemble de fonctions et de capacités (1 seul nœud par appareil en général)

Conforme à un ou plusieurs « device type », déterminés suivant la version de matter, qui définissent le(s) cluster(s) supporté(s)

Ex device type :
 base : node, app, client, server...
 utility : Root node, power source...
 app : on/off light, contact sensor, temp sensor, door lock...

Interface fonctionnelle qui définit les interactions (client/serveur) possibles

États actuels typés (bool, int, string..)

Matter to non-Matter Bridge

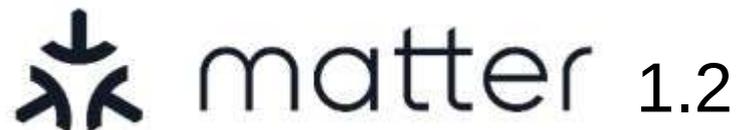

- **Complete Matter to non-Matter Solution: STM32H7** for Matter Bridged node & your preferred wireless solution for the non-Matter network (STM32WL, STM32WB, STM32WBA...)
- **Dedicated team to support** your Matter to non-Matter bridge project: define virtual device list, certification strategy, integration....

Device type	Connectivity	Wireless MCUs in standalone	Hosted architecture (MCU/MPU + radio companion)
Matter Gateway (Border router)	Thread RCP Ethernet / WiFi		RCP model STM32H7 + STM32WB STM32MP1 + STM32WB
Matter over Thread End Device	Concurrent Dynamic Thread - Bluetooth LE	STM32WB*	NCP model STM32H7 + STM32WB STM32U5 + STM32WB STM32MP1 + STM32WB
Matter bridge to no-Matter technologies	Any**		NCP STM32H7 + STM32WB STM32MP1 + STM32WB STM32H7 + STM32WL STM32MP1 + STM32WL

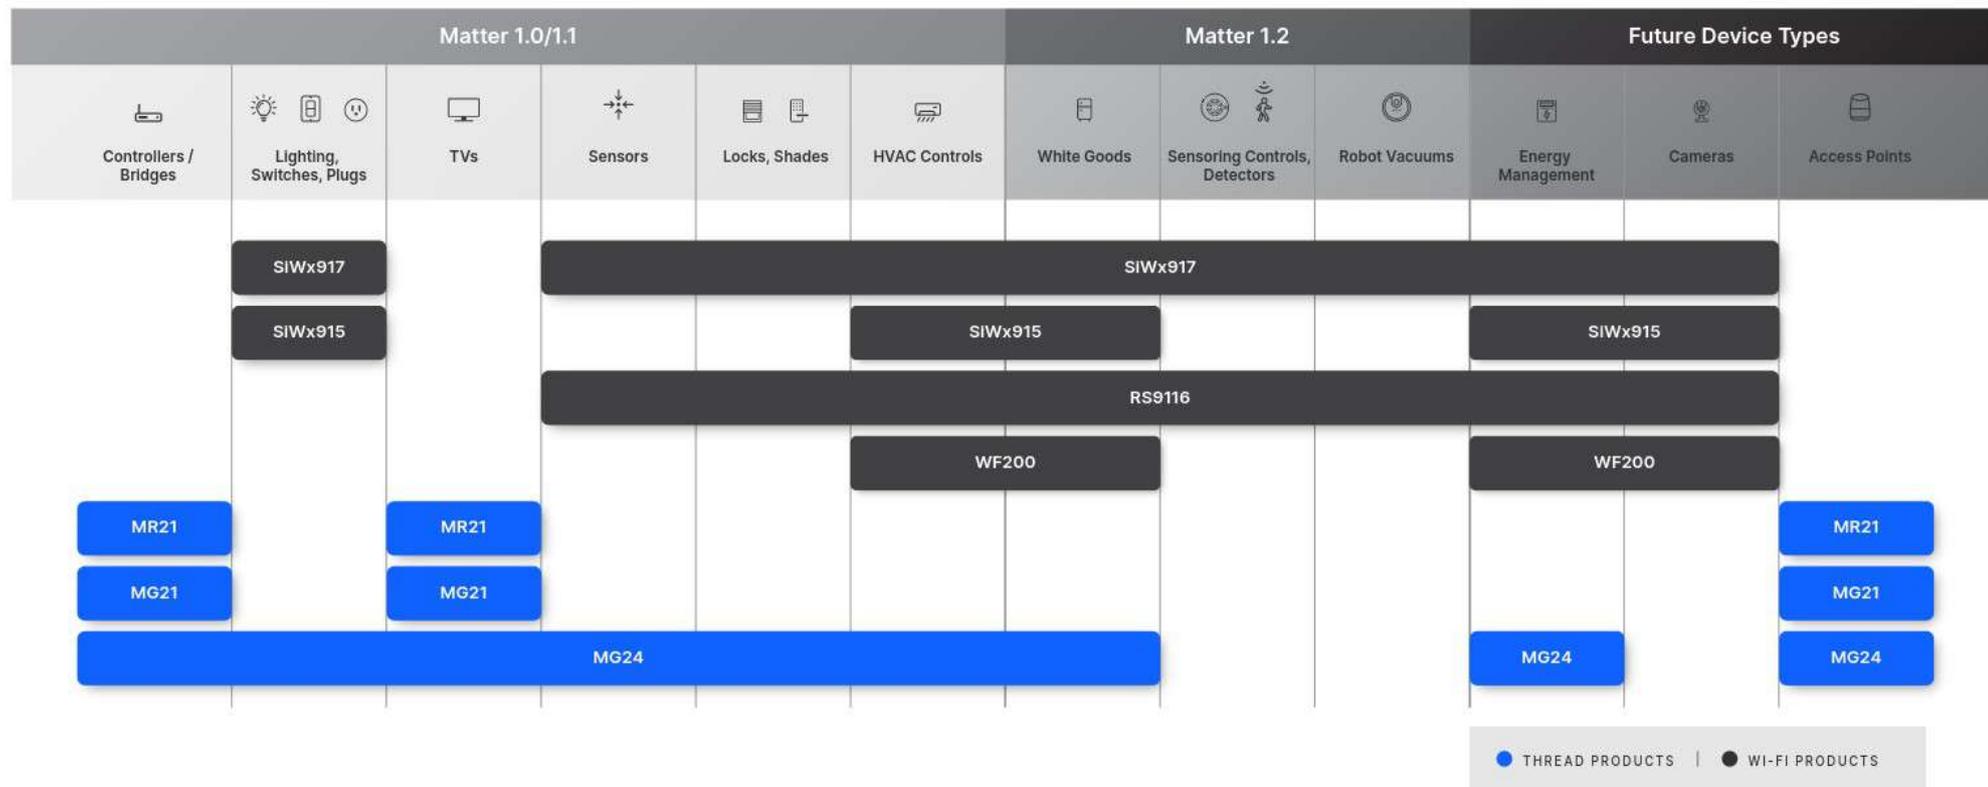

*OTA on external Flash

**data model bridging Matter to any other technology

Wi-Fi End Device

Our Wi-Fi-enabled SoCs and modules, such as those included in the ESP32, ESP32-C and ESP32-S series, can be used for building Matter-compatible Wi-Fi devices.

ESP32 ESP32-C2 ESP32-C3 ESP32-C6 ESP32-S3

Matter 1.2 (11/23)

Environnement de développement

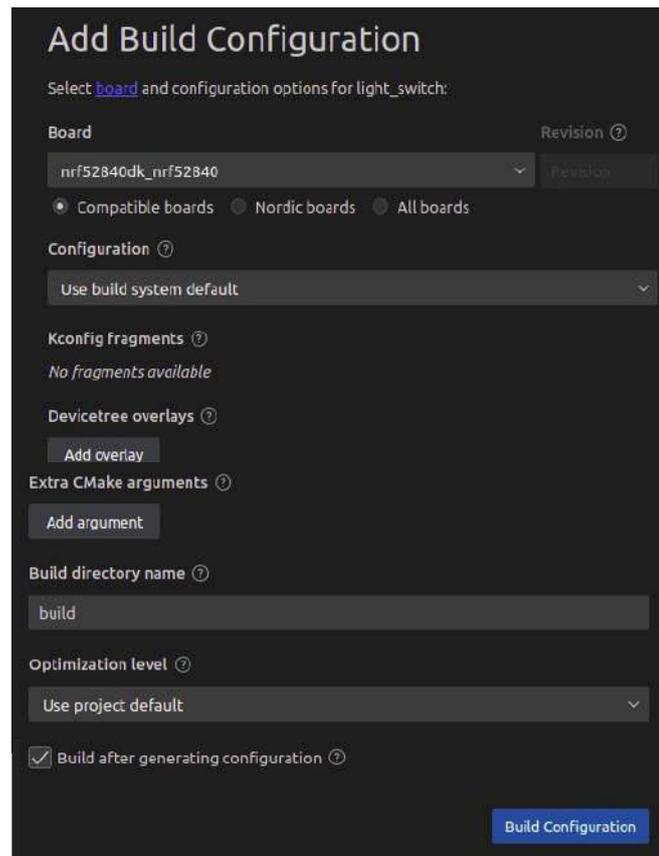

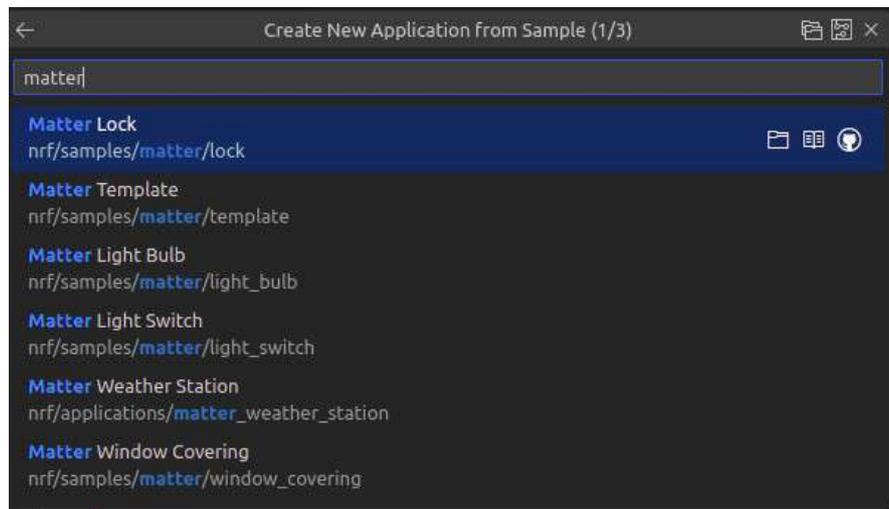

Ensemble des outils existant :

- SDK du fabricant de microcontrôleur retenu
- Interface de développement intégrée (IDE)
- API/stack Matter
 - Projet chip (Zigbee): <https://github.com/project-chip/connectedhomeip>
 - Inclus dans le sdk avec le compilateur
 - Inclus dans l'exemple

- Exemple : Nordic Semiconductor

nRF Connect SDK version	Matter specification version	Matter SDK version
v2.5.99 (latest)	1.2.0	1.2.0.1
v2.5.0	1.1.0	1.1.0.1
v2.4.2		
v2.4.1		
v2.4.0		
v2.3.0	1.0.0	1.0.0.2
v2.2.0		1.0.0.0
v2.1.4		1.0.0.0
v2.1.3		1.0.0.0
v2.1.2		1.0.0.0

- Nordic Semiconductor Visual studio + nrf connect sdk v2.2

- Nordic Semiconductor
- Exemple de gestion des valeurs d'attributs de cluster sur un device matter

Endpoint - 0

Device Matter Root Node (0x0016)

Endpoint - 1

Device Matter Contact Sensor (0x0015)

Endpoint - 2

Device Matter Contact Sensor (0x0015)

```
chip::app::Clusters::PowerSource::Attributes::BatVoltage::Set(/* endpoint ID */ 0, /* bat voltage */ batteryVoltage);
chip::app::Clusters::PowerSource::Attributes::BatPercentRemaining::Set(/* endpoint ID */ 0, /* bat percent */ batteryLevelInPercent);
```

```
chip::app::Clusters::BooleanState::Attributes::StateValue::Set(/* endpoint ID */ 1, /* boolean state */ false);
chip::app::Clusters::BooleanState::Attributes::StateValue::Set(/* endpoint ID */ 2, /* boolean state */ true);
```

- Génération du QR code
- Utilisation de chip-tool

```
$ ./chip-tool-debug payload generate-qrcode --vendor-id 0xFFFF1 --product-id 0x8000 --rendezvous 2 --discriminator 0x0F04 --setup-pin-code 25147864
[1700654700.221505][51803:51803] CHIP:T00: QR Code: MT:Y.K90-C714-U6037K00
```

--vendor-id : 0xFFFF1 = utilisé pour tous les exemples
 --product-id : 0x8000 = produit non répertorié
 --rendezvous 2 = commissioning via ble

- chip-tool / chip-tool-debug / chip-tool-release :
 - implémentation d'un contrôleur Matter
 - permet le commissioning (enregistrement sur le réseau)
 - fournit toutes les commandes d'interaction avec un end point matter

Contrôleur Matter

```
Usage:
./chip-tool-debug cluster_name command_name [param1 param2 ...]

-----
| Clusters:
-----
* accesscontrol
* accountlogin
* actions
* administratorcommissioning
* any
* applicationbasic
* applicationlauncher
* audiooutput
* ballastconfiguration
* barriercontrol
* basic
* binaryinputbasic
* binding
* booleanstate
* bridgeddevicebasic
* channel
* colorcontrol
* contentlauncher
* descriptor
* diagnosticlogs
* discover
* lock
```

- chip-tool / chip-tool-debug / chip-tool-release :
- Commissioning :

Contrôleur Matter

```

./chip-tool-debug pairing ble-thread 1
hex:0e0800000000000010000000300000d35060004001fffe0020865cd2860

54e60392a6f8110c0402a0f7f8
```

- chip-tool / chip-tool-debug / chip-tool-release :

- Interrogation :

```
./chip-tool-debug doorlock read lock-state 3 1
```

```
./chip-tool-debug levelcontrol read current-level 3 2
```

```
./chip-tool-debug booleanstate read state-value 2 1
```

```
./chip-tool-debug booleanstate read state-value 2 2
```

```
./chip-tool-debug powersource read bat-voltage 2 0
```

```
./chip-tool-debug powersource read bat-percent-remaining 22 0
```

```
./chip-tool-debug generaldiagnositics read active-hardware-faults 22 0
```

```
Periodic : ./chip-tool-debug powersource subscribe bat-voltage 10 20 2 2
```

- Commande

```
./chip-tool-debug doorlock unlock-door 3 1 --timedInteractionTimeoutMs 3000
```

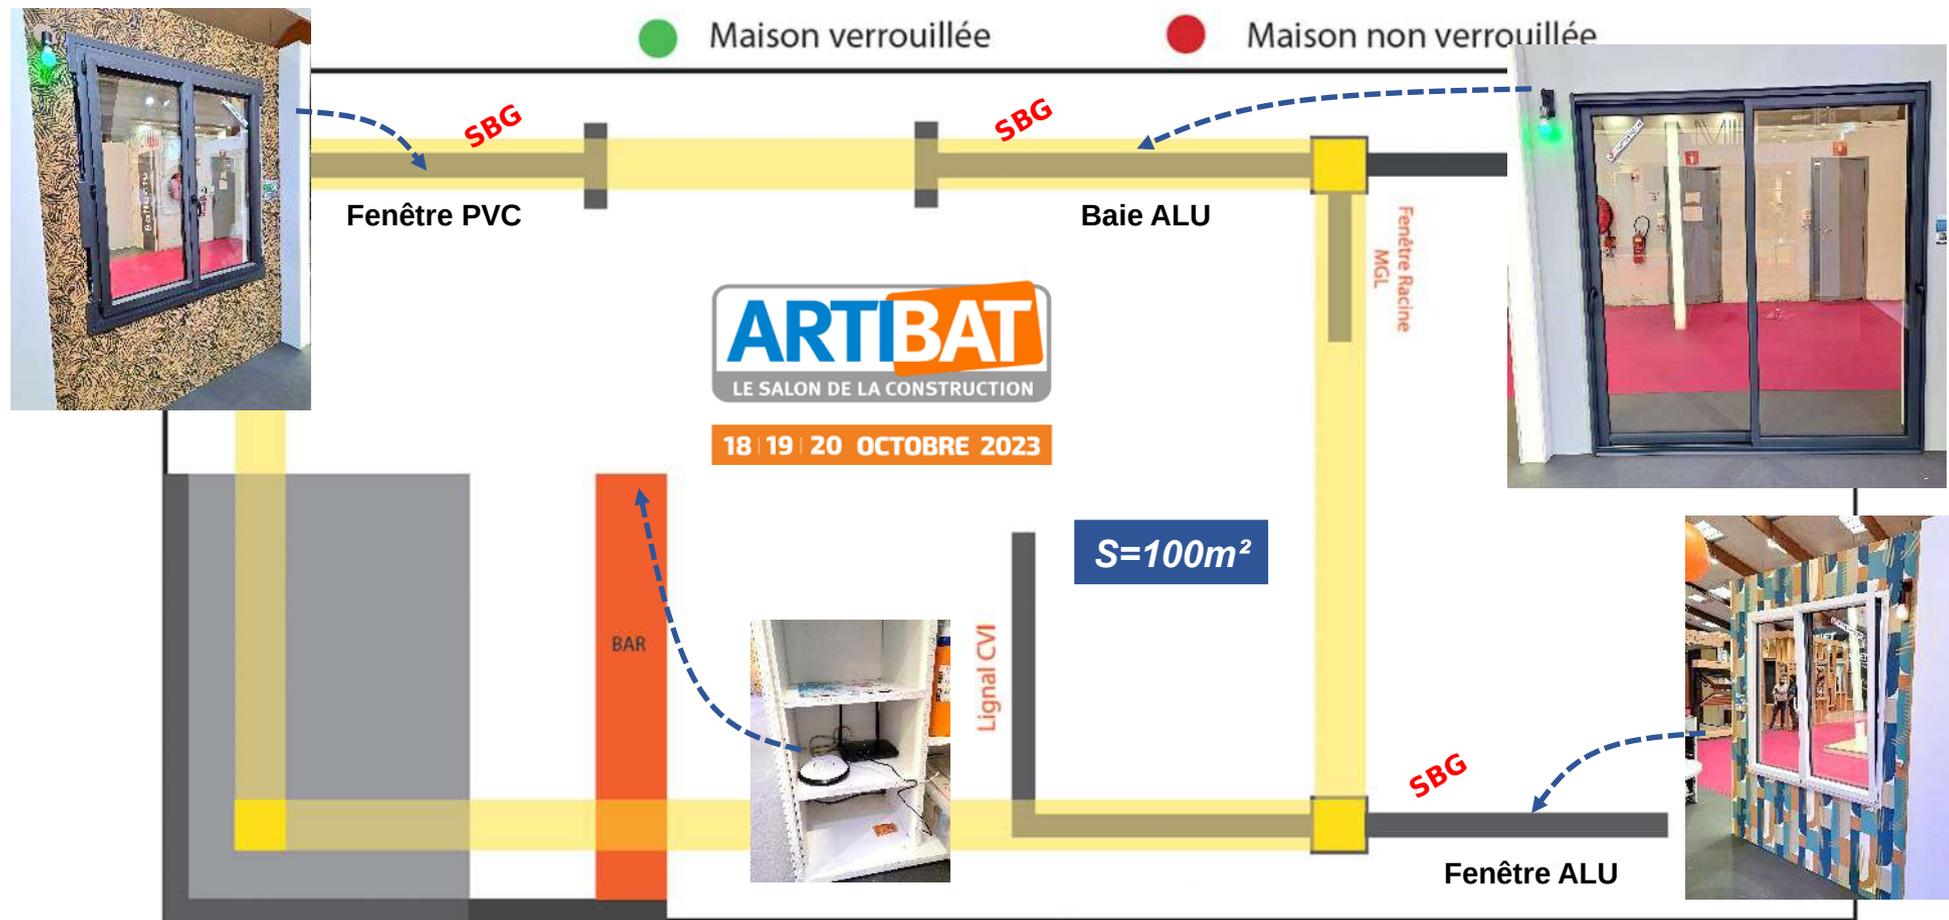

```
./chip-tool-debug doorlock lock-door 3 1 --timedInteractionTimeoutMs 3000
```
